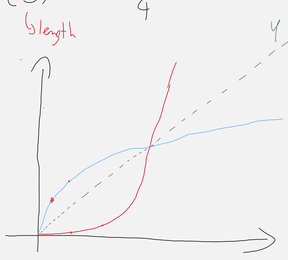
$T(L) = \frac{2\pi\sqrt{L}}{4}$ → 5

$T(5) = \frac{2\pi\sqrt{5}}{4} = 3.51$ → period of

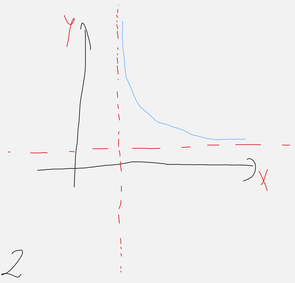


$T(L)$ → length

↳ period of oscillation

$T^{-1}\left(\frac{\pi}{2}\right) = 1$ → length of pendulum

↳ period of oscillation

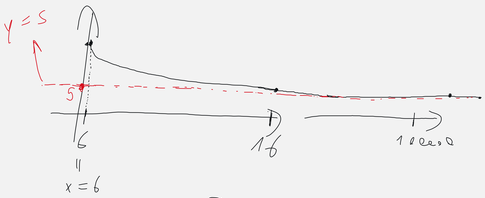


$g(x) = 4x^2 - \frac{3}{x} - 2$

$\frac{3}{x}$

$x = 0$

$6 \leq y \leq 16$



$f(6) = 2 + \frac{8}{6-5} = 2 + 8 = 10$

$2.73 \leq y \leq 10$

$f(10\,000000)$

$13 = 2 + \frac{8}{x-5}$

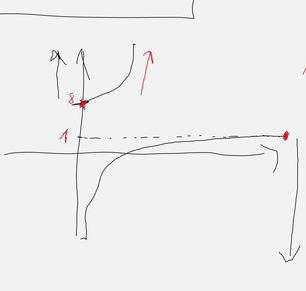
$11 = \frac{8}{x-5} \quad / \cdot (x-5)$

$11(x-5) = 8$

$11x - 55 = 8$

$11x = 63 \quad / : 11$

$x = 63/11$



$x \geq 8$

$y \leq 1$
