

Economics has empowered me with a logical approach to decision-making and a profound understanding of the world's complexities. My personal experiences, such as visits to my birthplace, India, have provided me with firsthand insights into the vast disparities in living standards and the transformative impact of rapid economic growth.

These experiences have ignited my curiosity about economic dynamics and their impact on society. Exploring books like 'Why Globalisation Works' by Wolf and 'Globalisation and its Discontents' by Stiglitz has broadened my understanding of the global economic landscape. These readings have highlighted the pivotal role of governments in fostering economic progress and the intricate challenges presented by urban overpopulation and unchecked pollution.

My participation in the RES essay competition, where I explored the concept of 'a global currency,' deepened my understanding of international finance. Reading Krugman's 'The Return of Depression Economics' emphasized the influence of market forces on government policies, transcending national boundaries. As part of the Target 2.0 challenge, I am working to refine my statistical analysis and presentation skills, with the aspiration of pursuing a career as a central banker or economist.

Beyond academics, I have honed my problem-solving abilities through involvement in robotics competitions, where I applied mathematical models to design efficient robots. Furthermore, my role as a student mentor allowed me to develop essential leadership skills and foster an environment of learning. Indeed, I frequently put these skills into practice when I founded the Economics Society at my school. Through this role, I've had the privilege of coordinating debates on current economic issues, further refining my understanding of economic theories. For example, I recently explored topics such as the state of the NHS and whether privatisation is inevitable.

In the pursuit of my own personal project, I hope to investigate how the euro and the wider integration of Europe can be made to benefit all member countries. I understand that this may involve the departure of some member states and the assumption of greater fiscal control over others. These are but two of a number of questions regarding the modern financial world that are arising in what an exciting time it is to be an economist.

I am enthusiastic about my academic journey at the university level, where I hope to study economics and explore its applications in addressing complex global challenges. My experiences and passion have prepared me for the rigorous academic discussions and problem-solving opportunities that await me in this exciting field.
